## Three analytic benchmarks in COG

Analytic benchmarks are valuable tools to test the algorithms in Monte Carlo codes not related to geometry or interaction data. COG $[1,2,3]$ was used to calculate three analytic benchmarks: Kobayashi's benchmarks for simple geometries and void regions [4]; Shmakov's benchmarks using the back-and-forth approximation [5]; and Thomas et al's critical problem for an infinite cylinder [6].

## 1) The Kobayashi benchmarks

The Kobayashi [4] benchmarks are a set of three problems, each consisting of three regions - source, void, and shield (void is actually shield with a density multiplier of 0.001 ). Problem 1 is a shield with square void, Problem 2 is a shield with void duct, and Problem 3 is a shield with dog-leg void duct. See reference [4] for the exact geometries. Fluxes were determined at various points through out the geometry. The analytic results are obtained for pure absorber shield. The Monte Carlo code COG was used to redo the benchmark calculations.

## Results for Problem 1 - shield with square void

| x,y,z | Analytic | COG | COG/Analytic |
| :---: | :---: | :---: | :---: |
| $5,5,5$ | $5.95659 \mathrm{E}+0$ | $5.9537 \mathrm{E}+0 \pm 1.48 \mathrm{E}-2$ | $0.99952 \pm 0.00250$ |
| $5,15,5$ | $1.37185 \mathrm{E}+0$ | $1.3718 \mathrm{E}+0 \pm 6.74 \mathrm{E}-5$ | $0.99996 \pm 0.00005$ |

Table 8. The analytic, and COG flux results for Problem 3C

Figure 8. The results for Problem 3C as the ratio of the COG flux to analytic flux

## Conclusions

The COG results are in excellent agreement with Kobayashi's analytic results.

## 2) The Back-and-forth Approximation

As described by Shmakov [5] the back-and-forth approximation is a simple neutron transport model that leads to analytic solutions for fissile systems in 1D geometries. The assumptions are threefold: 1) one group cross sections; 2) 1 D geometries - planar, cylindrical, or spherical; and 3) neutron s are allowed to move only in back and forth directions, i.e. normal to the plane, cylinder, or sphere.

## Results

A one-group cross section set for ${ }^{235} \mathrm{U}$ as described in Table 1 of reference [5] was developed for the Monte Carlo code COG.

| $\sigma_{\mathrm{s}}$ | 6.47 bn | scattering cross section |
| :--- | :--- | :--- |
| q | 0.1 | probability of back scatter for $\sigma_{\mathrm{s}}$ |
| $\sigma_{\mathrm{a}}$ | 0.13 bn | absorption cross section |
| $\sigma_{\mathrm{f}}$ | 1.25 bn | fission cross section |
|  | 0.5 | probability of back scatter for $\sigma_{\mathrm{f}}$ |
| $\mathrm{v}_{\mathrm{f}}$ | 2.6 | neutrons per fission |
| E | 1 MeV | neutron energy |
| v | $138 \mathrm{~cm} / 10^{-7} \mathrm{~s}$ | neutron velocity |

COG calculations are compared to Shmakov's analytic results.

Figure 9. COG results for $\mathrm{k}_{\text {eff }}$ versus radius, $\rho * \mathrm{R}$, for a uniform sphere, compared with the analytic results of Shmakov, eq. 2.11

Figure 10. COG results for $\lambda$ versus radius, $\rho * R$, for a uniform sphere, compared with the analytic results of Shmakov, eq. 7.8

Note: Shmakov's $\lambda$ is equivalent to COG's $\alpha / 10$, where $\alpha$ is given in generations/ $\mu$ sec.

Figure 11. COG results for $\mathrm{k}_{\text {eff }}$ versus radius, $\rho^{*}\left(\mathrm{r}_{0}-\mathrm{R}\right)$, for a hollow sphere, compared with the analytic results of Shmakov, eq. 3.13

|  | Analytic | COG | COG/Analytic |
| :---: | :---: | :---: | :---: |
| Leakage | 1.3234298 | $1.32335 \pm 0.00009$ | $0.99994 \pm 0.00007$ |
| Scattered | 5.9850792 | $5.98491 \pm 0.00019$ | $0.99996 \pm 0.00003$ |
| Fissioned | 1.1563136 | $1.15637 \pm 0.00007$ | $1.00005 \pm 0.00006$ |
| Absorbed | 0.1202566 | $0.12025 \pm 0.00003$ | $0.99995 \pm 0.00025$ |
| Collided | 7.2616495 | $7.26153 \pm 0.00022$ | $0.99998 \pm 0.00003$ |
| $\nu_{f}$ | 2.6 | 2.60002 | 1.00001 |
| $k_{\text {eff }}$ | 1.1563136 | $1.15637 \pm 0.00007$ | $1.00005 \pm 0.00006$ |

Table 9. Standard COG scores from a $\mathrm{k}_{\text {eff }}$ calculation for a hollow sphere with $\mathrm{r}_{0}=2 \mathrm{~cm}$ and $\mathrm{R}=12 \mathrm{~cm}$

The calculation was made using the above uranium cross section with $3 * 10^{7}$ particle histories. The scores, normalized to one fission event by COG, have
been renormalized to $\mathrm{k}_{\text {eff }}$ to compare with the analytic results given in Table 2 from reference [5].

Figure 12. The outward flux, U , and the inward flux, S , as a function of radius in the $\mathrm{r}_{0}=2 \mathrm{~cm}, \mathrm{R}=12 \mathrm{~cm}$ hollow uranium sphere, compared with the analytic results of Shmakov, eqs. 3.11 and 3.12

## Conclusions

It is seen the COG Monte Carlo one group cross section results agree excellently with the analytic results.

## 3) The infinite cylinder

Thomas et al [6] used the $\mathrm{F}_{\mathrm{N}}$ method to compute the critical radius for a bare cylinder of infinite length. We use the Monte Carlo code COG to reproduce these results.

## Results

A series of one group cross sections were generated for COG with $\Sigma_{\text {tot }}=$ $1 / \mathrm{cm}$, isotropic scattering, and $\mathrm{c}=1.01,1.02,1.05,1.1,1.2,1.3,1.4,1.5,1.6$, 1.8 , and 2.0 , where c is the mean number of secondary neutrons per collision. Then, for each c, COG was run in the criticality mode to compute $\mathrm{k}_{\text {eff }}$ as a function of radius to determine the critical radius. The results are shown in Table 10.

| c | Thomas et al | COG | Ratio |
| :---: | :---: | :---: | :---: |
| 1.01 | 13.12551647 | 13.129000 | 1.00027 |
| 1.02 | 9.04325484 | 9.071907 | 1.00317 |
| 1.05 | 5.41128828 | 5.406602 | 0.99913 |
| 1.1 | 3.57739129 | 3.576979 | 0.99988 |
| 1.2 | 2.28720926 | 2.287167 | 0.99998 |

Table 10. Compares the critical radius versus c
The flux versus radius was determined for $\mathrm{c}=1.05$ and 2 , the results are shown in Tables 11 and 12.

| r/R | Thomas et al | COG | Ratio |
| :---: | :---: | :---: | :---: |
| 0 | 1.000000 | $1.00450 \pm 0.01552$ | $1.00450 \pm 0.01552$ |

Table 12. Compares the flux versus radius with $\mathrm{c}=2$

## Conclusions

Again the COG Monte Carlo results are in excellent agreement with the analytic results.
